Project description

Climate change and the EU need for more secure energy sources accelerated the EU countries decision to cut greenhouse gases, increase of renewables in total energy production and cut energy consumption by improving energy efficiency. The package of EU climate and energy measures approved in December 2008 implements these targets. These reforms will make major contribution to combating climate change. It may however have great impact on national economies of EU member states. The Package effects' for Poland have been analyzed in the research project conducted by economists, lawyers and scientists.
